Hist.* Either of the two joint chief magistrates of the republic, originally of patrician rank and called also *prætores* or *judices.* The first Licinian law (B. C. 367) enacted that one consul should be plebeian, and the second (B. C. 342) that both might be. The consuls were originally elected by the comitia centuriata, but under the empire by the senate. Their term of office was one year until the empire, then to the death of Nero usually six months, and after that ordinarily two or four months, those first chosen each year being the ‖ **con'sul·les or'di·na'ri·i** (kŏn'sŭ-lēz ôr'dĭ-nā'rĭ-ī), by whose consulship official documents were dated, the later consuls in each year being called ‖ **con'sul·les suf·fec'tu** (sŭ-fĕk'tū). The emperors assumed or bestowed the office at will, sometimes taking the title of ‖ **con'sul per·pe'tu·us** (pẽr-pĕt'ū-ŭs). Their original supreme kingly powers were gradually taken away, until under the empire the office became a mere dignity. In the senate the ‖ **con'sul·les de'sig·na'ti** (kŏn'sŭ-lēz dĕs'ĭg-nā'tī), or consuls elect, had precedence in debate. At the end of his term a consul was usually commissioned by the senate as a proconsul to govern a province.

3. The modern consul corresponds to the ancient Greek *proxenus*, and originally had large local judicial powers, civil and criminal, over the citizens of the country represented, as the consuls of the civilized countries still have in some more barbarous countries. He is ordinarily not accredited to the sovereign or minister of the foreign government, and therefore not a diplomatic agent (see under DIPLOMATIC), but may be, where he has large judicial powers. Consuls are ranked as **consuls general, consuls, vice consuls,** and **consular agents,** the first being the highest.

Syn. — Have, keep, retain; inclose, embody, take in, cover. — CONTAIN, HOLD, COMPREHEND, COMPRISE, EMBRACE, INCLUDE, SUBSUME. TO CONTAIN is to have (something) within, or as an element, fraction, or part; HOLD, as here compared, stresses the idea of capacity to contain, or of keeping or retaining; as, The bookcase *contains* (i. e., actually has in it) fifty volumes, but *holds* (i. e., is capable of containing) a larger number; a bushel *contains* (not *holds*) four pecks, a bushel basket *holds* (not *contains*) a bushel, this basket *contains* (or *holds*) apples; the compound *contains* iron, which it *holds* in solution; his philosophy *contains* some elements of truth; the place was too hot to *hold* him. But the distinction between *hold* and *contain* is often inconsiderable or disregarded. To COMPREHEND (so also COMPRISE; see etym.) is to contain, usually within a more or less definite (often compendious) class, scope, or limit; EMBRACE, as here compared (see ADOPT), usually implies a somewhat more extensive compass; as, "If there be any other commandment, it is briefly *comprehended* in this saying, namely, Thou shalt love thy neighbor as thyself" (*Rom.* xiii. 9); "A third kind of female orators may be *comprehended* under the word gossips" (*Spectator*); "If one short volume could *comprise* all that was witty, learned, and wise" (*Swift*); "In whom all beauties are *comprised* in one" (*Pope*), "The other productions of this indefatigable scholar *embrace* a large circle of topics" (*Prescott*). To INCLUDE is to comprise, esp. as a constituent or subordinate element of a whole, or as a part of a total; as, "The loss of such a lord *includes* all harm" (*Shak.*); "The class man is *included* in the class mortal" (*J. S. Mill*); an edition of the Bible which *includes* the Apocrypha; thirty days, *including* Sundays. To SUBSUME (see etym.) is to take up or include under a general class or proposition; as, "He [Whitman] wishes to drag with a larger net, to make a more *comprehensive* synthesis. . . . In feeling after the central type of man, he must *embrace* all eccentricities; his cosmology must *subsume* all cosmologies . . .; his statement of facts must *include* all religion and all irreligion, Christ and Buddha, God and the Devil" (*Stevenson*).

to contain one number with respect to another, *Arith. & Alg.,* to consist of two parts that contain the two numbers respectively; as, 31 *contains* 5 with respect to 3, since $31 = 5 \times 5 + 3 \times 2$.

con-tam'i-nate (kŏn-tăm'ĭ-nāt), *v. t.;* CON-TAM'I-NAT'ED (-nāt'ĕd); CON-TAM'I-NAT'ING (-nāt'ĭng) [L. *contaminatus,* p. p. of *contaminare* to bring into contact, to contaminate, fr. *contamen* contagion, for *contagmen; con-* + root of *tangere* to touch. See CONTACT.] To soil, stain, or corrupt by contact; to defile or pollute.

Shall we now
Contaminate our fingers with base bribes? *Shak.*

Syn. — Soil, sully, stain; infect, corrupt, poison; befoul, desecrate, debauch, dishonor. — CONTAMINATE, TAINT, DEFILE, POLLUTE agree in expressing impairment of purity. CONTAMINATE and TAINT imply loss of purity resulting, in the one case, from mixture or contact, in the other, from infection or putrefaction; as, water may be *contaminated* by surface drainage, the air *tainted* by decayed matter. DEFILE is a stronger term, POLLUTE stronger still, for such soiling or sullying as renders an object foul or unclean; as, a bird may *defile* its nest, a sewer may *pollute* a stream. In general, the figurative senses accord with the literal. See CORRUPT.

Fly the world's *contaminating* touch *Cowper.*
As a pestilence that *taints* the air is more destructive than poison infused in a draft *Johnson*

2. *Philol.* Blending of two words or phrases of similar meaning into a new word or phrase, usually through confusion; as in *insinuendo,* from *insinuation* and *innuendo; whirlicane,* from *whirlwind* and *hurricane.* Cf. ANALOGY.

Nevertheless, we may lay it down that for analogy we must demand a sufficient number of examples on which to base a rule; while for *contamination,* a single form or construction may suffice *Strong, Logeman, Wheeler*

When, however, the associative interference of the second word is stronger and both synonyms have about equal share in the creation of the new form, we are accustomed to speak of *contamination.* *Oertel.*

3. A similar blending or confusion in the case of manuscripts (resulting in the occurrence in a single manuscript of readings belonging to different lines of tradition) or of legends or stories (resulting in new combinations of incident or in other modifications of plot).

contamination by successive association. = ASSIMILATORY CONDENSATION.

Syn. — CONTEMPORARY, CONTEMPORANEOUS, COEVAL, SYNCHRONOUS, SIMULTANEOUS, COINCIDENT agree in the idea of existing, living, or occurring at the same time. In CONTEMPORARY and CONTEMPORANEOUS (of which *contemporary* is applied more frequently to persons, *contemporaneous* to events) the time regarding which agreement is implied is indefinite ; as, Shakespeare was *contemporary* with Cervantes, who died on the same day ; Shakespeare's last year was also *contemporaneous* with Molière's first ; the reign of Louis XIV. was *contemporaneous* with the Commonwealth in England, as also with the Restoration and the revolution of 1688, a history based on *contemporary* accounts. COEVAL usually implies contemporaneousness for a long, or at a remote, period or time ; as, " Every one knows that the Roman Catholic religion is at least *coeval* with most of the governments where it prevails " (*Burke*) ; " Mr. —, in his poem, makes trees *coeval* with Chaos " (*Coleridge*). SYNCHRONOUS implies an exact correspondence between the (usually brief) periods of time involved ; SIMULTANEOUS more frequently denotes agreement in the same point or instant of time ; as, two pendulums so adjusted that their movements are *synchronous ;* the two shots were *simultaneous.* COINCIDENT (see AGREE) applies to events which are regarded as falling or happening (sometimes in a notable or singular manner) at the same time ; as, the discovery of America was almost *coincident* with the capture of Granada ; his sudden departure was suspiciously *coincident* with the stranger's arrival. The power of punishing for *contempt* is incident to all superior courts ; inferior courts are usually restricted to the punishment of contempts done in the presence of the court. *Contempt* is in some jurisdictions restricted so as not to include publications reflecting injuriously on a court of justice or on its procedures.

3. Scornful, contemptuous. *Obs*

Syn. — Vile, low, mean, base, worthless, sorry, insignificant, inferior, beggarly, groveling. — CONTEMPTIBLE, DESPICABLE, PITIFUL, PALTRY, SORDID, CHEAP, ABJECT. CONTEMPTIBLE applies to that which is worthy only of contempt ; DESPICABLE is a stronger term, and frequently implies keen and scornful, sometimes indignant, disapprobation ; as, "There is no vice or folly . . . which, by ill management, makes so *contemptible* a figure [as vanity]" (*Swift*), " I know none so *despicable* as those who despise others " (*Fielding*) ; " In proportion as he became *contemptible* to others, he became *despicable* to himself " (*Goldsmith*). PITIFUL (see PITEOUS) suggests such littleness or insignificance as stirs contemptuous pity ; as, " The whole lot to be divided is such a beggarly matter. . . . Take that *pitiful* additional fraction of a share . . , which thou so wantest " (*Carlyle*). PALTRY (see etym.) suggests pettiness or worthlessness, as of trumpery or baubles, as, " a quarrel . . . about a hoop of gold, a *paltry* ring " (*Shak.*) ; " We love the man, the *paltry* pageant you " (*Cowper*) ; " The part I have acted has been in open day ; and to hold out to a conduct which stands in that clear and steady light . . . the *paltry* winking tapers of excuses and promises — I never will do it " (*Burke*). SORDID (cf. BASE) implies degrading attachment to low, mean, or inferior things ; as, " In psalm and antiphon, inexhaustibly fresh, the soul seemed to be taking refuge from the *sordid* languor and mean business of men's lives " (*W. Pater*). CHEAP, as here compared, implies contempt bred by familiarity ; as, " Had I so lavish of my presence been, so common hackney'd in the eyes of men, so stale and *cheap* to vulgar company " (*Shak.*) ; " Be admonished . . . not to strike leagues of friendship with *cheap* persons " (*Emerson*). ABJECT implies a mean-spirited or groveling attitude ; as, " It is *abject*, and creeps " (*Jonson*) ; " Although I wished to be thought meek, I would not be *abject ;* although humble, not mean " (*Richardson*) ; " His wife may do what she pleases . . . he has no weapon left but tears and the most *abject* submission " (*Stevenson*). See DESPISE, CONTEMPTUOUS, PETTY, PARSIMONIOUS.

—con-temp'tu-ous-ly, *adv.* **— con-temp'tu-ous-ness**, *n.*

Syn. — Haughty, arrogant, insolent, supercilious, contumelious. — CONTEMPTUOUS, SCORNFUL, DISDAINFUL. CONTEMPTUOUS expresses one's attitude towards what is deemed mean, vile, or worthless ; as, " Johnson replied to Macpherson's letter by one of *contemptuous* brevity and pith " (*Leigh Hunt*) ; " A *contemptuous* disdain of all natures less coarse than his own " (*Lord Cockburn*). *Contemptuous* is not to be confused with *contemptible* (see CONTEMPTIBLE), which is properly applied to the object of contempt ; as, *contemptible* conduct, a *contemptible* fellow. SCORNFUL implies proud, often mocking, sometimes scathing, contempt ; as, " Withal it is a silent pain too, a silent *scornful* one ; the lip is curled in a kind of godlike disdain of the thing that is eating out his heart " (*Carlyle*) ; " You nimble lightnings, dart your blinding flames into her *scornful* eyes " (*Shak.*). DISDAINFUL implies haughty, sometimes even insolent, disregard or contempt ; as, " Nor Grandeur hear with a *disdainful* smile the short and simple annals of the poor " (*Gray*) ; " Curled *disdainful* mustachio " (*Carlyle*) ; " Is the calm shine of stoic souls, who weigh life well, and find it wanting, nor deplore ; but in *disdainful* silence turn away, stand mute, self-centered, stern, and dream no more ? " (*M. Arnold*). See DESPISE, ARROGANT.

Syn. — Struggle, encounter, battle, dispute, altercation, contention, strife. — CONTEST, CONFLICT, COMBAT, FIGHT, AFFRAY, FRAY. CONTEST is the broadest term, and originally referred merely to strife in argument (see etym. under *v. t.*); it is now applicable to any struggle, whether friendly or hostile, for a common object, and often implies considerable duration; as, "All the *contest* is now 'twixt God and Dagon. Dagon hath presumed . . . to enter lists with God" (*Milton*); "What mighty *contests* rise from trivial things" (*Pope*). CONFLICT (see etym.) implies a closer engagement, in which sense it is applied to actual fighting; as, "Arms on armor clashing brayed, . . . dire was the noise of *conflict*" (*Milton*). Fig., *conflict* frequently denotes a struggle (often spiritual or mental) between opposing principles or forces; as, "There is [in a Shakespearean tragedy] an outward *conflict* of persons and groups, there is also a *conflict* of forces in the hero's soul" (*A. C. Bradley*). COMBAT is less commonly used in a fig. sense (as, a *combat* against despair); it implies esp. an armed encounter between two (whether individuals, or parties regarded as units), frequently for the determination of a dispute; as, "Let these have a day appointed them for single *combat* in convenient place" (*Shak.*); "I . . . said he lied . . . and defied him to the death, if he . . .; had the inclination to be genteel in the way of *combat*" (*Byron*). FIGHT usually implies a hand-to-hand conflict; it ranges in dignity from a spiritual struggle (as, "Fight the good *fight* of faith," 1 *Tim.* vi. 12) to actual fisticuffs; as, a prize *fight.* AFFRAY (see etym. under *v. t.*) and FRAY (which occasionally has more dignified connotation) commonly refer to a tumultuous disturbance or brawl; as, "Where are the vile beginners of this *fray?* O noble prince, I can discover all the unlucky manage of this fatal brawl" (*Shak.*). For the legal sense of *affray*, see def. See CONTENTION, CONTEND, BATTLE, ENCOUNTER, DISPUTE.

See CONTINUOUS.] **1.** Quality or state of being continuous; uninterrupted connection or succession; close union of parts; cohesion; as, the *continuity* of fibers. *Continuity* signifies identity with respect to a series of changes. This identity may be no more than an identity of medium or measure, as in the case of time and space. In such case the continuities are expressed in series of like units — for example, minutes or inches — whose mere repetition forms the contrasting change. It was with reference to this type that Aristotle defined *continuity* as "that in which adjacent parts have their limits in common," that is, adjacent parts are reciprocally limits of one another and there is no third element, no interruption, between them. There is, however, another type of *continuity*; that is, a qualitative identity, in which the uninterrupted persistence of some quality in time or space is continuous with reference to conjoint changing qualities. Cf. CONTINUUM.

The sight would be tired, if it were attracted by a *continuity* of glittering objects. *Dryden.*

In specifying what is to be counted we specify at once the nature of the *continuity* and the rule of the discretion. *B. Bosanquet.*

A function of a single variable $f(x)$ is *continuous at a point* *a* when it is defined for an interval containing *a* and has a limit $f(a)$ at *a*, for an unrestricted domain about *a*. If it has the limit $f(a)$ on the left at *a*, then it is *continuous to the left* at *a*, and so for the right. It is *continuous throughout an interval* when continuous at every point within the interval, also to the right at the smaller end value and to the left at the larger end value. When not so continuous at these end values, it is continuous *within* but not *throughout the interval*. — **c. girder** *or* **beam**, a girder or beam having more than two supports. See THEOREM OF THREE MOMENTS.

con-tin'u-um (kŏn-tĭn'ū-ŭm), *n.*; *pl.* CONTINUA (-ă). [L., neut. of *continuus* continuous.] **1.** That which is absolutely continuous and selfsame; that of which no distinction of content can be affirmed except by reference to something else (as duration and extension, which are capable of supporting distinctions only by reference to numbers or to such relations as those of *now* to *then*, *here* to *there*, *before* to *after*); secondarily, that of which the only assertable variation is variation in time or space.

Out of what is in itself an undistinguishable, swarming *continuum*, devoid of distinction or emphasis, our senses make for us, by attending to this motion and ignoring that, a world full of contrasts, of sharp accents, of abrupt changes, of picturesque light and shade *Wm. James.*

2. Anything in which a fundamental common character is discernible amid a series of insensible or indefinite variations; as, a sensation *continuum*; also, any identity of substance uniting discrete parts; hence, loosely, a continuity.

3. *Math.* A continuous magnitude or extent; a continuity. According to Georg Cantor, it is a **perfect connected aggregate** (of *elements* or *points*) of *n* dimensions when each element corresponds to a set of simultaneous values of *n* independent real variables $x_1, x_2, \ldots x_n$, called coordinates of the point. The *difference* of any two points is the sum of the absolute differences $|x_1-x'_1|$ etc., of the corresponding coördinates. The *neighborhood* of any point is the aggregate of all points (in the continuum) that differ from it by not more than a certain positive *h*. A **limiting point** is one whose neighborhood for *h*, however small, forms itself an infinite aggregate; it need not be itself *in* the aggregate. A **perfect aggregate** contains all its own limiting points and no other points. An aggregate is **connected** when between any two points, *a* and *b*, may always be found *m* other points, $a_1, \ldots a_m$, whose successive differences $|a_1-a|, |a_2-a_1|, \ldots, |b-a_m|$ are each less than any preassigned σ, however small. Familiar examples of continuities are space and figures in it, time, and the aggregate of all real numbers. But the aggregate of rational numbers is everywhere *discontinuous*, because of the *cuts* made by the infinitely many intermediate irrationals.

F. *contrat*, formerly also *contract.* See CONTRACT, *v.*] **1.** *Law.* An agreement between two or more persons to do or forbear something, esp. such an agreement that is legally enforceable; a bargain; a compact; a covenant. A legal contract was defined by Blackstone as "An agreement upon sufficient consideration to do or not to do a particular thing," and this has been the generally accepted definition, either literally or in one paraphrase or another adopted to express more plainly one or more of the necessary elements of a contract, such as the mutuality. The law writers have, until recently, generally classified contracts as: **contract of record**, a conclusive legal obligation incurred through the intervention of some public authority and evidenced by public record, as judgments, recognizances, statutes merchant and staple, **contract of specialty,** or **specialty contract,** one depending for its validity upon the formality of its execution, that is, upon its being signed, sealed, and delivered in the form called a *deed;* and **simple,** or **parol, contract,** one not depending upon formality of execution for its validity, but upon the existence of a consideration. Contracts of record are now usually classified as *quasi contracts* (which see), as not being properly called contracts If a seal (which see) does not import a consideration Blackstone's definition covers only the simple contract. Various classifications of contracts with reference to different principles are made; as: unilateral and bilateral; gratuitous and onerous; real and consensual; executed and executory; aleatory or not, etc. (see these terms). Cf. COVENANT, PACT, NUDUM PACTUM, CAUSE, 3, CONSIDERATION, 7, DEED, etc.

The commonwealth [of the United States] are inhibited from passing any law impairing the obligation of *contracts* (Constitution, Art. I., sec. 10, § I). . . . The term *contract* has, in this connection, been made subject to exhaustive definition by the courts It is held to mean a legally binding agreement in respect to property, either expressed or implied, executory or executed, between private parties, or between a commonwealth and a private party or private parties; or a grant from one party to another; or a grant, charter, or franchise from a commonwealth to a private party or private parties. *J. Syn. — Arrangement, understanding, convention, pact. — CONTRACT, AGREEMENT, BARGAIN, COMPACT, COVENANT, STIPULATION, agreeing in the idea of a mutual arrangement between two parties, are here compared in their more general senses. For their specifically legal usage see defs. AGREEMENT is the most general term; it frequently implies little more than a mutual understanding. CONTRACT applies esp. to such formal agreements, often of a business nature, as are legally binding; BARGAIN, esp. to agreements regarding purchase and sale. A COMPACT is a stronger and more solemn contract, frequently applying to alliances between states; COVENANT has special reference to religious engagements. A STIPULATION is one of the articles or provisions of a contract. See PROMISE.

According to some versions of the story, a regular *contract* to the above effect was drawn up by a lawyer, and signed and sealed in the presence of witnesses. Others say that Matthew Maule was contented with a private written *agreement*, in which Mr. Pyncheon pledged his honor and integrity to the fulfillment of the terms concluded upon. The gentleman then ordered wine, which he and the carpenter drank together, in confirmation of their *bargain.* . . . There was, at least, an assignable motive for the first *stipulation;* there appeared to be none whatever for the last. *Hawthorne.*

Thus the exponential series, $1 + x + \frac{x^2}{1.2} + \frac{x^3}{1.2.3} + \ldots$, converges for all finite values of x, but the logarithmic series, $x + \frac{1}{2}x^2 + \frac{1}{3}x^3 + \ldots$ converges only for $|x| < 1$. The limit to which the sum of the first n terms approaches as n becomes ever larger is called the *sum* of the series.

con'verse, *n.* [Cf. F. *converse.*] **1.** In general, that which is related to something else in a way that is converse, or turned, its statement being derived from that of the other by transposing two antithetical terms; as, "a rainy day and a clear night" is the *converse* of "a clear day and a rainy night;" this belief and its *converse* are both held.

3. *Math.* A proposition formed by the interchange of hypothesis and conclusion in a previous proposition. Converses, however, are not generally true.
4. *Logic.* A proposition obtained by conversion; as, the converse of "all men are animals" is "some animals are men," the converse of "no virtue is vice" is "no vice is virtue;" — not to be confounded with "*contrary* proposition." See CONVERSION, 4.
Syn. — CONVERSE, OBVERSE, REVERSE. CONVERSE applies to propositions; it implies an interchange or transposition of the important terms; as, the *converse* of "None but the brave deserves the fair" is "None but the fair deserves the brave." *Converse* is not to be confused with *opposite* (see OPPOSITE) or *reverse*, thus, the *opposite* of "None but the brave deserves the fair" would be "All but the brave deserve the fair;" "Francis I. wrote, after the battle of Pavia, 'All is lost except our honor.' A hissed author may *reverse* it — 'Nothing is lost except our honor'" (*Byron*). OBVERSE and REVERSE are specifically applied to the two faces of a coin, medal, etc.; *obverse* referring to the side containing the head or principal inscription, *reverse*, to the other. More generally, *obverse* refers to the more, *reverse* to the less, apparent or intentionally conspicuous side or face of anything; as, "Looking at the fair tapestry of Life, with its royal and even sacred figures, he dwells not on the *obverse* alone, but here chiefly on the *reverse*, and indeed turns out the rough seams, tatters, and manifold thrums of that unsightly wrong side" (*Carlyle*). In their more absolute uses, *obverse* corresponds to *counterpart, reverse* to *opposite*; as, evil is the *obverse* of (i. e., necessarily answering to) good; evil is the *reverse* (i. e., the direct opposite) of good. See COMPLEMENT, REVERSE.

con-ver'sion (kŏn-vûr'shŭn), *n.* [L. *conversio*: cf. F. *conversion.* See CONVERT.] **1.** Act of converting, or state of being converted (in any sense); as: **a** From one position or direction to another **b** From one view or course to another, as in passing from one side, party, or form of religion to another. 4. *Logic.* Act of interchanging the terms of a proposition, as by putting the subject in the place of the predicate, or the contrary. A simple conversion is a mere transposition of subject and predicate, and is valid of universal negative, particular affirmative, and some universal affirmative propositions. Con-ver'sion per ac'ci-dens (pûr ăk'sĭ-dĕnz) (accidental conversion) involves change of quantity from universal to particular, as well as transposition of the subject and predicate, and is employed in case of universal affirmatives. Particular negatives cannot be converted.
Conversion is usually treated with opposition under the head of immediate inference. It is primarily a transition from one grammatical form to another which introduces no new elements into the content *B Bosanquet.*
5. *Mil.* **a** A change of front, as of a body of troops. **b** A change of character or use, as of smoothbore guns into rifles. **c** The formation of a bridge (called a bridge by conversion) by swinging into position a series of pontoons already constructed parallel to the shore for that purpose.

con'vert (kŏn'vûrt), *n.* **1.** A person converted from one opinion or practice to another, a person who is won over to, or espouses, a creed, religious system, or party, which he did not before believe in or espouse; esp., one who turns from the controlling power of sin to that of holiness. **2.** A lay brother or sister; a converse. *Obs.*

Syn.—CONVERT, PROSELYTE, NEOPHYTE. CONVERT implies a hearty, usually genuine, embracing of some creed, opinion, or doctrine which one has previously rejected or, at least, not accepted; it is commonly taken in a good sense; as, a *convert* to Christianity, to free trade, to protection. PROSELYTE properly applies to an adherent of one system (esp. religious) who has transferred himself or been gained over to another; it is a somewhat ambiguous term, frequently implying a change in mere externals, and sometimes suggesting unworthy or ulterior motives; as, "Ye compass sea and land to make one *proselyte*" (*Matt.* xxiii. 15); "You agree with the rest of the married world in a propensity to make *proselytes*" (*Shenstone*). A NEOPHYTE is a new convert; the term is frequently applied to a novice in anything (see NOVICE); as, "Her whole soul was possessed by the fact that a fuller life was opening before her; she was a *neophyte* about to enter on a higher grade of initiation" (*G. Eliot*); "Just as the Deputy Grand Master was bringing in the mystic gridiron for the reception of a *neophyte*" (*Thackeray*). See PERVERT.

2. *Law.* The act by which the title to property, esp. real estate or a vessel, is transferred; transfer of ownership; an instrument in writing (as a deed or mortgage) by which the title to property is conveyed from one person to another. Down to the 17th century conveyances were chiefly distinguished as in **pais**, that is, made in the country, or according to the old common law, and on the land itself; and of **record**, that is, effected by assurances in the superior courts. Later, various new classes of conveyances were introduced, depending on statutes for their force. The conveyances of these various classes are: (1) Common-law conveyances: feoffment, grant, lease, exchange, partition, called **primary**, and release, confirmation, surrender, assignment, defeasance, and lease and release, called **secondary** or **derivative**. (2) Conveyances by statute law: feoffment to uses, covenant to stand seized to uses, bargain and sale, lease and release, and grant to uses. (3) Conveyances by matter of record: fine, recovery, private act of Parliament, and royal grant. A devise or will is also reckoned as a conveyance in the broadest sense of the word. The earlier common-law conveyances which required notoriety or publicity in the transaction, as in livery of seizin, and fines and recoveries involving public judicial proceedings, are called **notorious**; the modern conveyances by mere delivery of a deed between the parties are called **secret**, even though the deed be recorded. The earlier conveyances might operate to convey a greater estate than that of the conveyor, as where a tenant for years conveys a fee simple by feoffment, and this was called a **tortious** conveyance; conveyances by deed have been distinguished as **innocent**. All conveyances are now innocent by statute both in England and the United States. Conveyances are now practically always by deed, the deed of grant being the one generally used for freeholds in England since 1845. See CONVEY, *v. t.*, 6, CONVEYANCING, 2.

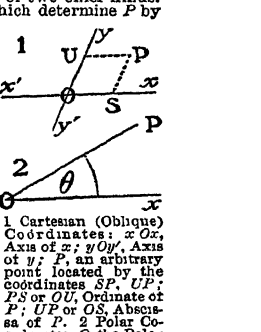
2. *Math.* Any of a number, usually a system, of magnitudes that characterize the elements of a continuum, distinguishing one from another; specif., any of two or more magnitudes that determine position, esp. of spatial elements, as of points, planes, etc. Thus, latitude and longitude are *coördinates* of a point on the earth's surface. There are many systems of coördinates, among the chief being the following: (1) **Areal coördinates,** which fix a point *P* by the areas (with proper signs) of three triangles having the point as common vertex and the three sides of a fixed fundamental triangle as bases. (2) **Barycentric coördinates.** See TRIANGULAR and TETRAHEDRAL COÖRDINATES, below. (3) **Biangular coördinates,** which fix *P* by the angles *PF F'* and *PF' F* (or their cotangents), where *FF'* is a fixed straight segment in the plane. (4) **Bicircular coördinates,** which define *P* as the intersection of a pair of circles meeting at a constant angle. These are of two chief kinds. (5) **Bilinear** or **vectorial coördinates,** which determine *P* by its distances (*r* and *r'*) from two fixed foci. Many ovals and similar curves are easily expressed in these coördinates, as the ellipse ($r + r' = 2a$), the hyperbola ($r' - r = 2a$), the curve of attraction for two otherwise isolated magnetic poles ($\frac{1}{r} + \frac{1}{r'} = k$), etc. (6) **Binary coördinates,** nonhomogeneous coördinates locating a point or line in a plane. (7) **Bipunctal coördinates,** which determine a line by the segments between it and two foci on two fixed parallel rays. (8) **Cartesian coördinates,** the two line segments drawn from a point in a plane each to one, and parallel to the other, of two lines crossing each other in a plane and dividing it into four compartments, as xOy, yOx', $x'Oy'$, $y'Ox$ (see fig. 1). The fixed lines $x'Ox$, yOy', are called the axes, and their intersection *O* is the *origin.* The segment *SP* (or *OU*) is called the *y coördinate* (or *ordinate* or *y*) of *P*, and the segment *OS* (or *UP*), the *x coördinate* (or *abscissa* or *x*). Coördinates reckoned rightward or upward receive the sign +, those reckoned leftward or downward the sign —. When yOy' (the *y axis*) is oblique to $x'Ox$ (the *x axis*) the coördinates are



1 Cartesian (Oblique) Coördinates: *x Ox*, Axis of *x*; *y Oy'*, Axis of *y*; *P*, an arbitrary point located by the coördinates *SP*, *UP*; *PS* or *OU*, Ordinate of *P*; *UP* or *OS*, Abscissa of *P*. 2 Polar Coördinates: *O*, the Pole; *Ox*, Polar Axis or Origin of Direction; *OP*, Radius Vector. The coördinates *OP* (a length) and *xOP* (an angle), locate *P*.

oblique, when at right angles to it, *rectangular*. This system is extended to points in space, a point being located by the three line segments drawn from it, each to the plane of two axes and parallel to the other; these three coordinate axes determine three planes (the *coördinate planes*), which pass through a fixed point (the *origin*, *O*) and thus divide three-dimensional space into eight compartments. (9) **Curve coördinates**, for determining curves. (10) **Curvilinear coördinates**, for defining points on a curved surface. (11) **Elliptic coördinates**, which determine *P* as the intersection of two confocals in the plane or of three in space (an ellipsoid and two hyperboloids). (12) **Generalized coördinates**, three values of three parameters in three equations of three sets of surfaces, which determine each a surface of its set, which three surfaces determine a point as their common intersection. (13) **Homogeneous coördinates**, in which the ratios of coördinates (one more than necessary) are substituted for the coördinates themselves, which renders the equations (all but one) homogeneous. (14) **Isothermal coördinates**, which locate *P* in a plane by the intersection of two orthogonal curves. (15) **Line coördinates** (in Plucker's sense), six homogeneous coördinates, connected by one condition, which fix a line in space. (16) **Orthotomic coördinates**, which locate *P* in space by the intersection of three mutually orthogonal surfaces. (17) **Point coördinates**, for simply fixing a point. (18) **Polar coördinates**, which determine *P* by its radius vector (r) from the origin and the angle (θ) to this radius vector from a fixed half line, the *origin of direction* or *polar axis* (*Ox* in fig. 2, *O* being the origin). These coördinates are often called r, θ *coördinates*, *OP* being usually called r and the angle xOP, θ. Polar coordinates can also be used in three-dimensional space, a point being located by its radius vector (r) from an origin (*O*) and its latitude (ϕ) and longitude (θ) on a sphere about that origin as center. These are usually called r, ϕ, θ *coördinates*. (19) **Projective coördinates**, determining elements (projective, not metrical) that define a point (or plane) by the *order* they establish among the points of a line (or the planes of a pencil) free from all metrical considerations. (20) **Quadriplanar coördinates**, which fix *P* in space by the line segments measured in fixed directions from it to four fixed planes. (21) **Rodrigues's coördinates**, which fix the position of a rigid body with one fixed point by the direction cosines of an axis through the point and the angle of rotation about it. (22) **Spherical coördinates**, which determine *P* on a sphere, as by latitude and longitude. See POLAR COÖRDINATES, above. (23) **Tangential coördinates**, determining lines in a plane, or planes in space. (24) **Tetrahedral coördinates**, a kind of quadriplanar coördinates whose sum is constant. (25) **Triangular coördinates**, a kind of trilinear coördinates in which the sum of the coördinates is constant. (26) **Trigonometrical coördinates.** = SPHERICAL COÖRDINATES. (27) **Trilinear coördinates**, which determine *P* in a plane by proportionals to its distances from three fixed lines in the plane. (28) **Vectorial coördinates.** = BILINEAR COÖRDINATES.

Since the 7th century the Coptic Church has been so isolated from modifying influences that in many respects it is the most ancient monument of primitive Christian rites and ceremonies. But centuries of subjection to Moslem rule have weakened and degraded it. — **C. rite,** the rite of the Coptic Church. — **C. version** (of the Bible). See VERSION.

For convenience, logicians usually consider only *is* and *is not* as true copulas. *Is*, however, is considered to have two uses or meanings: first, where it serves properly as a copula, joining subject and predicate without necessarily affirming the actual existence of either (but cf. BE, *v. i.*, 1); as in "a griffin *is* an animal combining traits of the lion and the eagle;" second, where it is used merely to affirm existence, or as a predicate; as in "a lion *is*," that is, "has actual being;" "a griffin *is* not," that is, "has no actual being." By some logicians the copula is conceived as essentially the (expressed or implied) relationship to reality of any given judgment, and so is contained in any verbal form which conveys such a relationship.

The real nature of the *copula* we have seen already. It is the mere sign of affirmation, and, though usually conveyed by a finite verb in languages which possess one, does not depend on tense. *B. Bosanquet.*

In the United States the Constitution (Art. 1, sec. 8) empowers Congress to "promote the progress of science and the useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries." The term "writings" has been construed to include maps, charts, music, prints, engravings, drawings, paintings, and photographs, as well as books, written and printed matter, etc. The first statute was passed in 1790; the act now in force went into effect July 1st, 1909. The term of copyright is 28 years, with right of renewal for 28 years on due application with a corresponding renewal right as to existing copyrights obtained under previous statutes. See LITERARY PROPERTY. In Great Britain the first copyright law was the Act of 8 Anne, c. 19; the act now mainly governing the subject is the Copyright Act of 1842 (5 & 6 Vict. c. 45), which provides for the copyright of books for the life of the author and seven years thereafter, or a period not less than forty-two years in any event. Under this statute "book" has been construed to include "every volume, part or division of a volume, pamphlet, sheet of letterpress, sheet of music, map, chart, or plan."

certainly relaxed in favor of ecclesiastical bodies by the Christian emperors, and was not, as a general rule, insisted upon during the Middle Ages" (*T. E. Holland*). A corporation is generally considered to be a juristic person, that is, one existing only by fiction of law. Some modern law writers, however, reject the conception of a person existing by legal fiction, and explain a corporation as merely a number of natural persons acting under special rules of agency, or presentation, and governed by special rules of succession; others, going to an opposite extreme and maintaining the **anthropomorphic** theory, so called, regard the corporation as having a true personality other than the sum or resultant of its members, and not created, but merely recognized, by the law.

3. *Eng. & Amer. Common and Statute Law.* A body politic or corporate formed and authorized by law to act as a single person, and endowed by law with the capacity of succession; an entity recognized by law as constituted by one or more persons and as having various rights and duties together with the capacity of succession; a juristic person constituted by one or more natural persons. The definition most commonly accepted by judicial decision in the United States is that of the Dartmouth College Case (see cit., below). Such a corporation can be formed only by prescription, patent of the crown, or legislative act, either special or general. (See CHARTER, ARTICLES OF ASSOCIATION.) *Corporations* having two or more members, called **corporations aggregate**, are the more usual form. Such corporations are constituted by the mayor and aldermen of cities, the head and fellows of a college, the dean and chapter of a cathedral church, the stockholders of any industrial or financial company, etc. A *corporation* consisting of a single person is called a **corporation sole**. Kings, bishops, deans, parsons, and vicars, are in England sole corporations; there are few instances of such corporations in the United States. As classed according to their purposes, corporations are: **ecclesiastical corporations**, or those concerned only with religious matters and consisting wholly of spiritual persons; and **lay corporations**, including all others. Lay corporations may be, **eleemosynary corporations**, or those created for charitable uses (which see); and **civil corporations**, or those formed for temporal purposes, and comprising **public**, or **municipal, corporations**, or those created for purposes of government, and **private corporations**, including all others of a civil nature, as ordinary business corporations and those corporations, such as railroad companies, lighting companies, water companies, etc, organized or chartered to follow a public calling (see PUBLIC, *a.*) or to render services more or less essential to the general public convenience or safety, and now often called **public-service corporations** or sometimes **quasi-public corporations**. With reference to their limited powers various corporations consisting of a person or body of persons invested with some of the qualities of an artificial person, though not expressly incorporated, esp. the officials of certain municipal divisions such as counties, school districts, and the towns of some States of the United States, certain church officials, as a churchwarden, etc, are called **quasi corporations** (hence **quasi-corporateness**), those with fuller powers, such as the ordinary business or ecclesiastical corporation, being sometimes called **complete corporations**. Cf COMPANY, 6.

Syn. — Right, proper, true, faultless, perfect, strict, definite, rigorous, scrupulous, particular, punctilious, prim. - CORRECT, ACCURATE, EXACT, PRECISE, NICE agree in the idea of conformity to standard, fact, or truth. CORRECT, the most colorless term, denotes scarcely more than freedom from fault or error, as judged by some (usually) conventional or acknowledged standard; as, *correct* dress, style, deportment; "Sedley's valet, the most solemn and *correct* of gentlemen" (*Thackeray*); (colloq.) "the *correct* thing." ACCURATE implies, more positively, conformity to fact or truth attained by the exercise of care; as, an *accurate* investigation, statement, observer. PRECISE stresses rather sharpness of definition or delimitation, or such scrupulous exactness of conformity to the standard as often verges on excess; as, the *precise* meaning of a word, *precise* utterance, garb; "a *precise* and proper definition of the title" (*Gibbon*). NICE (see NICE) implies still greater, occasionally excessive, fineness or delicacy of observation or discrimination; as, a *nice* calculation, distinction, point of law, "more *nice* than wise." More commonly, to CORRECT is to bring into conformity with some standard or rule; to RECTIFY, to set right, make good, or remedy, with special reference to a mistake or defect, or its results; as, to *correct* proof, to *correct* grammatical errors, to *correct* a copy by comparison with the original; to *rectify* an error in an account (by *correcting* the statement); "Could we but bring him back before the discovery of the judge's death, the evil might be *rectified*" (*Hawthorne*). *Correct* sometimes applies to persons (as, to *correct* a child, to *correct* one for bad grammar); *rectify*, never. a particular individual is called **private cost**, or often *expense;* the cost of anything to the community is called the **public cost**, and is represented by the total amount of capital (used in its widest sense) consumed or rendered unavailable. The cost of a thing as reckoned in terms of the amount of labor, or effort, and abstinence required to produce it is often called the **real**, or **subjective, cost.** The old theory was that this directly determines value. The more modern theory is that the relative cost of different articles has only an indirect effect on value by causing the labor and capital of a country to be used in those branches of production in which the product is largest in comparison to the cost of production. This is called the law of **comparative cost.** Since the price for which anything is ordinarily sold is essentially what is paid for it in money, *cost* is often used in the sense of *price.* In any enterprise involving large capital the costs or expenses are of two kinds: one set necessary for the management of the undertaking as a whole, such as administration, interest, taxes, and general maintenance; the other directly connected with particular portions of the business, taking the form of wages, supplies, and special repairs in a railroad. The former class of expenses vary comparatively little with the amount of business done; the latter are in almost direct proportion to it. Expenses of this latter class, which can be divided or apportioned among specific pieces of business, are said to be *direct.* Expenses of the former class are said to be *indirect.* Different writers have used various other terms to express this distinction, distinguishing cost as *distributed* and *undistributed, specific* and *general, operating* and *fixed, prime* and *supplementary.* (*Alfred Marshall.*)

Cost is, in the last analysis, pain inflicted, just as utility is pleasure conferred. *J. B. Clark.*

cot'ton (kŏt'n), *n.* [F. *coton*, Sp. *algodon* the cotton plant and its wool, *coton* printed cotton, cloth, fr. Ar. *qutun, alqutun*, cotton wool.] **1.** A soft, white, fibrous substance composed of the twisted hairs clothing the seeds of various malvaceous plants, esp. of the genus *Gossypium*. Careful selection has greatly improved the quality and increased the length (staple) of the fiber. The southern United States yield about 85 per cent of the total cotton crop, the remainder being grown in Egypt, India, China, Brazil, and a few other countries. On account of its cheapness and durability, cotton is the most important of textile products. It is also used extensively in medicine and surgery and in the arts. Chemically it is almost pure cellulose.
2. The cotton plant, also, collectively, the crop. The plant is of erect and freely branching habit, with alternate lobed leaves and large yellow flowers, becoming red the second day, subtended by a cup-shaped involucre composed of several large fringed bracts. The fruit (boll) is a capsule which bursts open when ripe, allowing the seeds and attached cotton to be easily picked. Most of the cotton grown in the United States belongs to two types: **upland cotton** (*Gossypium hirsutum*) with a short staple, and **sea island cotton** (*G. barbadense*) with a long, silky staple. The important cottons of other countries are the Peruvian, Egyptian, Brazilian, and Indian varieties.

CONCILIATE.] **1.** Formerly, any gathering or convocation; now, an assembly of men summoned or convened for consultation, deliberation, advice, or agreement upon some concerted action; as, a *council* of physicians for consultation in a critical case.

2. Specif.: **a** *Eccl.* An assembly of ecclesiastics convened to consider doctrine or discipline or questions between church and state. The earliest councils were provincial, and known as **metropolitan councils**, from the fact that metropolitan bishops presided over them. Later, **provincial synods** were instituted with authority over several of these; still later, **national councils**. With respect to the early church and the Roman Catholic Church, ecclesiastical *councils* or *synods* in general are of five kinds: **General**, composed of bishops and theologians from different nations (which become **ecumenical** when accepted by the church in general); **national**, composed of the bishops and other clergy of one nation; **provincial**, in which the bishops and other clergy of one province meet (called also **convocations**); **diocesan**, in which the bishop of the diocese or his representative presides. In Protestant usage the term is applied to such gatherings as have been called by the general or denominational alliances, as the Evangelical or the Pan-Presbyterian Alliance, or by churches in the Congregational body. But no such body pretends to lay down laws for the whole church. Of the ecumenical councils (see ECUMENICAL) there are some 20 recognized by the Roman Catholic Church. Their names, dates, and the matter acted upon are given in the table below. The first six are accepted as ecumenical by the churches of the Anglican Communion and the first seven by the Eastern Church.

county borough. See COUNTY,

3. In Great Britain and Ireland, one of the territorial divisions constituting the chief units for administrative, judicial, and political purposes. The first districts to be called *counties* were the old Anglo-Saxon shires, often called the **ancient**, or **geographical**, **counties**, or, more commonly, **counties at large**, which had various historical origins going back to Anglo-Saxon days. Later the term was applied to: **a** Certain duchies (as Cornwall, Shetland, etc.). **b** Certain districts consisting of cities or towns with neighboring territory separated out of the older shires and given the organization of counties (and called **counties corporate**, or **corporate counties**). **c** Administrative divisions (often not coincident with the older counties) to which the administrative functions (but not the judicial or political ones) of the older counties have been transferred under the Local Government Act of 1888, and which are called **administrative counties**. Some of these administrative counties consist of boroughs of more than 50,000 inhabitants, which are specifically called **county boroughs**. **d** Territorial divisions, called **registration counties**, which are aggregates of the registration districts for births, deaths, and marriages. **e** In Scotland, the 33 **civil counties** into which the country is divided, the Local Government Act of 1889 having extended to Scotland a system of county government substantially the same as that of England.

4. In the United States, the largest division for local government in all States except Louisiana, where the corresponding division is the *parish*. The administrative functions of the county are more important than those of the town in the Southern States, less important than those of the town in the New England States, and in the Middle and Western States of about equal importance. The county is subdivided for governmental purposes into minor civil **divisions** (so called), such as townships, towns, plantations, locations, purchases, grants, surpluses (which see), etc. Cf. *quasi corporation* and *municipal corporation*, under CORPORATION, 3.

It represented the older shire moot, and its jurisdiction was chiefly judicial, as a court of first instance in both civil and criminal cases and of appeal from the minor courts, but it also had certain administrative and, at least in some cases, some legislative powers. The suitors were the judges, or doomsmen, of the court, and decree of outlawry could be declared only at this court. The contentious jurisdiction of the court fell into disuse before the creation of the statutory county courts. (See def. 2, below.)

2. In England, any of various judicial courts for civil actions established by the County Courts Act of 1846 (9 & 10 Vict. c. 95), mainly for the recovery of small debts. Their jurisdiction has been largely increased.

In the fishes and amphibians the number is regularly only ten. The spinal accessory is wanting, but the hypoglossal is frequently replaced by the first cervical spinal nerve. The others correspond to those of the higher vertebrates. — **c. segments,** *Anat. & Zoöl.*, three annular segments into which the bones of the cranium proper may be grouped. Beginning behind, they are the *occipital*, consisting of the basiocciput, exoccipitals, and supraoccipital; the *parietal*, of the basisphenoid, alisphenoids, and parietals; and the *frontal*, of the presphenoid, orbitosphenoids, and frontals. — **c. vertebræ,** *Anat. & Zoöl.*, divisions of the whole skull which have been considered as representing modified vertebræ.

The object of this science, which originated with Anders Retzius in 1842 and was elaborated by Paul Broca in 1861, is to distinguish racial types by variations in the form and traits of the skull (cf. MAN). The most important of the many skull measurements are those which give: the **cephalic index,** or proportion of greatest breadth to greatest length; the **facial angle,** or degree of gnathism (expressed also by the **gnathic index**); and the **cranial capacity,** or cubic contents of the calvaria, or brain case. Minor peculiarities of the shape of the skull are expressed by the **auriculoparietal, auriculovertical, basilar, coronofrontal, craniofacial, frontoparietal, occipitoparietal, sphenoparietal, transversovertical,** and **vertical indices.** Peculiarities of face and feature are expressed by the **dental, facial, frontal, nasal, orbital, orbitonasal,** and **palatal indices.** (See these terms.) The chief craniometrical points used in determining these indices are shown in the following diagram. For precise study, esp. the making of photographs

and projections, skulls are referred to a fixed horizontal position, or norm, called the **norma horizontalis.** In France and in English-speaking countries this is usually the **alveolocondylean plane of Broca**; in German-speaking countries it is the **auriculo-infraorbital plane** (see *Illust.*). With reference to this plane six aspects of the skull are distinguished: the **norma facialis,** or **frontalis,** viewing the full face; the **norma lateralis,** or **temporalis,** viewing the skull from the side; the **norma occipitalis,** from behind; the **norma basilaris,** from below; the **norma verticalis,** from above; and the **norma mediana,** viewing a median section.

Syn. — CRANIOMETRY, CRANIOSCOPY, CRANIOLOGY, CRANIOGRAPHY, CEPHALOMETRY. In strict usage CRANIOMETRY is distinguished from CRANIOSCOPY, which describes the anatomical and morphological peculiarities of skulls, and from CRANIOGRAPHY, which embraces photographic and cartographical studies. All three are branches of CRANIOLOGY. *Craniometry* is also distinguished from CEPHALOMETRY, the measurement of the living head.

This condition is found in the embryos of all craniate vertebrates. In many of the lower forms, as the sharks and lampreys, it persists through life, usually becoming more or less calcified. In all the higher vertebrates distinct bones are formed in its place, and become more or less fused together. But in these animals the cranium comprises also other bones, formed in membrane (see OSSIFICATION), and the term *chondrocranium* is sometimes applied to the part of it that is preformed in cartilage. > The title [*Creole*] did not first belong to the descendants of Spanish, but of French, settlers. But such a meaning implied a certain excellence of origin, and so came early to include any native of French or Spanish descent by either parent, whose nonalliance with the slave race entitled him to social rank. Later, the term was adopted by, not conceded to, the natives of mixed blood, and is still so used among themselves. . . . Besides French and Spanish, there are even, for convenience of speech, "colored" *Creoles;* but there are no Italian, or Sicilian, nor any English, Scotch, Irish, or "Yankee" *Creoles*, unless of parentage married into, and themselves thoroughly proselyted in, Creole society. *G. > The term *creole* negro is employed in the English West Indies to distinguish the negroes born there from the Africans imported during the time of the slave trade. The application of this term to the colored people has led to an idea common in some parts of the United States, though wholly unfounded, that it implies an admixture greater or less of African blood. *R. It is remarkable as an antiseptic and deodorizer in the preservation of wood, flesh, etc., and in the prevention of putrefaction; but it is a poor germicide. The European house or hearth cricket (*Gryllus domesticus*) has been naturalized in parts of America. It lives in human dwellings, often between the bricks of fireplaces. *G. neglectus* is one of the common large black American species, several of which also enter houses. European House Cricket.

crick'et, *n.* [Of uncertain origin; cf. F. *criquet* a game of skill.] An outdoor game played with bats, ball, wickets, etc., usually between sides of eleven players each. The wickets are pitched (i. e. stuck vertically in the ground) at the centers of the two bowling creases (see *Illust.*), lines each 6 feet 8 inches in length and 22 yards apart, from or behind which the ball must be bowled. At each end of the bowling crease is a short limiting line called the return crease. The position of the batsman is fixed by the popping crease, a line 4 feet from either bowling crease. A bowler bowls a certain number (usually 6) of consecutive balls constituting an over, alternating with another at the other end. The score is counted by runs, a run being scored by the batsmen crossing between wickets when a ball is hit to a safe distance, or when the ball is missed by the wicket keeper (see BYE, *n.*, **2 a**) or by a fielder. The batsman is out: (1) when his bail is displaced by a fair ball (bowled); (2) when the batted ball is caught before it reaches the ground (caught); (3) when his bail is displaced while he is out of his crease, i. e., when he has not either a foot or his bat on the ground behind his popping crease (being stumped when he is so put out by the wicket keeper when attempting to play a bowled ball, or run out when so put out by a fielder in attempting a run); (4) when his leg intercepts a fair ball so as to prevent it from hitting the wicket (leg before wicket, abbr., *l. b. w.*); (5) when he violates any of various rules. An innings is finished when all but one of the batsmen are out, the remaining batsman being declared not out. In single wicket there is but one batsman, the bowler's position being marked by a stump called the bowling stump. The game with two batsmen is often called double wicket. The positions of the players vary according to circumstances, those shown in the illust. being for fast bowling, and the players are often called by the names of their positions, as point, short slip, etc. Varying positions (some not shown) are: deep field, near the boundary; square leg, in line with the striker's wicket on the same side as, but farther out than, short leg; long-off, on the off boundary; long-on, on the on boundary; silly leg, silly mid-off, silly mid-on, silly point, and silly slip, corresponding to short leg, mid-off, mid-on, point, and short slip, but much closer to the wicket. See BOUNDARY, 2, BREAK, *n.*, 8 **d**, WICKET, etc.

The six systems commonly recognized are: 1. The **isometric system,** having three equal axes at right angles, as in the cube, regular octahedron, etc. 2. The **tetragonal system,** having three axes at right angles, but only two, the lateral axes, equal, as in the right square prism. 3. The **hexagonal system** (including the **rhombohedral** division), having three equal lateral axes intersecting at angles of 60° and a vertical axis of variable length at right angles, as in the hexagonal prism. 4. The **orthorhombic system,** having three unequal axes at right angles, as in the right rhombic prism. In this system the lateral axes are called, respectively, **macrodiagonal** and **brachydiagonal.** 5. The **monoclinic system,** having three unequal axes, with one oblique intersection, as in the oblique rhombic prism. In this system the lateral axes are called, respectively, **clinodiagonal** and **orthodiagonal.** 6. The **triclinic system,** having all three axes unequal and intersections oblique, as in the oblique rhomboidal prism. The rhombohedral division of the hexagonal system is made a separate **rhombohedral system** by some authors, the forms being referred to three equal oblique axes parallel to the faces of the fundamental rhombohedron. Each system embraces several classes (e. g., the isometric system, five) which differ in symmetry, though referred to the same axes (see SYMMETRY). With regard to optical and similar properties isometric crystals are **isotropic,** while all others are **anisotropic,** being either uniaxial (tetragonal, hexagonal) or biaxial (orthorhombic, monoclinic, triclinic).

See COIN.] **1.** Wedge-shaped; — applied esp. to the wedge-shaped or arrowheaded characters of ancient inscriptions of Persia, Assyria, etc., and hence also to the inscriptions themselves. *Cuneiform* writing is thought to have originated with the pre-Semitic inhabitants of Mesopotamia at least 6,000 years ago, whence it spread widely, remaining in use until the 3d century B. C. The chief cuneiform signaries or syllabaries, often called alphabets, are the Sumerian or Accadian, Assyro-Babylonian, New Susian, Old Persian, and Armenian. Of these the oldest is the Sumerian, with ideographic characters. The Assyro-Babylonian is the most important both in extent and length of use; it is also the most complicated. Its syllabic characters were written from left to right. The phonetic characters of Old Persian, employed from the 6th to the 4th century B. C., form the simplest system of cuneiform, and were the first to be deciphered, giving a key to the other systems. The form assumed by the cuneiform characters was due to their being most often inscribed on soft clay, on which the easiest stroke was a straight line. Their characteristic arrow-shaped heads were probably from the initial touch of the stylus. Cf. HIEROGLYPHICS.

Syn. — Deceitful, designing, tricky, politic, sharp, subtle, insidious, stealthy, foxy. — CUNNING, CRAFTY, ARTFUL, SLY, WILY agree in implying an aptitude for attaining an end by secret or devious means. CUNNING (see etym., and cf. *knowing*, under SHREWD), as here compared, implies skill, esp. in overreaching or circumventing; it frequently suggests a low order of intelligence; as, "Certainly there is a great difference between a *cunning* man and a wise man, not only in point of honesty, but in point of ability" (*Bacon*); "A dark, *cunning*, roguish countenance, with small eyes" (*G. Borrow*). CRAFTY implies more secret or underhand devices than *cunning*, and frequently suggests an adroitness at deception acquired by experience; as, "the underhand *craftiness* of his [Jacob's] mother Rebecca" (*Coleridge*); "Whose pious talk, when most his heart was dry, made wet the *crafty* crowsfoot round his eye" (*Tennyson*). ARTFUL (cf. *artless*, under SIMPLE) implies more insinuating indirectness of dealing; as, "—— is a good-natured old easy fool, and has been deceived by the most *artful* of her sex" (*Sterne*); "She had, by the most *artful* conduct in the world, . . . insinuated herself into his favor" (*Fielding*). SLY, as here compared, implies a somewhat vulgar turn for what is covert or double; as, "with knowing leer and words of *sly* import" (*Irving*); "wrinkled *slyness* and craft pitted against native truth and sagacity" (*Hawthorne*). WILY (see ARTIFICE) implies the subtle use of tricks and stratagems, esp. in attack or defense; as, "Soft, as the *wily* fox is seen to creep, where bask on sunny banks the simple sheep" (*Pope*). See STEALTHY, SECRET, SHREWD.

2. State of being current; general acceptance or reception; a passing from person to person, or from hand to hand; circulation; as, a report has had a long or general *currency;* the *currency* of bank notes.

3. That which is in circulation, or passes from hand to hand, as a medium of exchange, including coin, government notes, and bank notes; as, the silver *currency;* the note *currency.* The term *currency* includes as well the part circulating at its market value (for example, gold coins in the United States) as the part that owes more or less of its purchasing power to government fiat or to its representative character, as paper money, subsidiary coins, or bank notes. Sometimes *currency* is used only of the fiat or representative money; usually, however, where this has driven the other out of circulation.

4. The total sum or amount of such medium of exchange in circulation, — in which summation bank checks are occasionally, but incorrectly, included.

5. Current value; general estimation; the rate at which anything is generally valued.

currency doctrine *or* **principle**. *Banking.* The principle that banks should issue notes only against coin or bullion; — a term first used as the name of the theory on which Peel based the act of 1844 by which the note issue of the Bank of England is still regulated. The principle is based on the assumption that notes are not merely forms of credit, but money or currency in a special sense; that mere convertibility will not prevent an overissue of notes; and that such overissue increases the quantity of money in circulation and thus raises prices. The opposing theory (called the *banking doctrine* or *principle*) holds that bank notes represent a form of banker's credit, and should not be subject to special regulation, and assumes that freedom from regulation is essential to an elastic currency, the fluctuation of which will be regulated by business conditions.

cur'rent (kŭr'ĕnt), *a.* [ME. *currant*, OF. *curant*, *corant*, p. pr. of *curre*, *corre*, F. *courre*, *courir*, to run, fr. L. *curreve;* perh. akin to E. *horse*. Cf. 3. *Elec.* A movement of electricity analogous to the motion of a stream of water or other liquid; also, the rate of such a movement. An electric current results from a difference of potential between two points, just as a current of water results from a difference of level, and this difference is measured in volts. The current, or rate of flow, is measured in amperes; it depends on the difference of potential and the resistance to be overcome. The quantity delivered is measured in coulombs; it depends on the current and the time during which it flows.

CURSE (opposed to *blessing*) implies the desire or threat of evil, declared solemnly or upon oath; as, "The untented woundings of a father's *curse* pierce every sense about thee!" (*Shak.*). IMPRECATION denotes an invocation of evil or calamity; EXECRATION, an expression of intense hatred or utter detestation; as, "With *imprecations* thus he fill'd the air, and angry Neptune heard the unrighteous prayer" (*Pope*); "Those acts of perfidy, midnight murder, usurpation, and remorseless tyranny, which have consigned his name to universal *execration*, now and forever" (*Southey*). OATH, as here compared, denotes a blasphemous calling to witness of God or sacred things; as, "He [Peter] denied with an *oath*" (*Matt.* xxvi. 72). ANATHEMA is specifically the solemn curse of the church; in ordinary usage it has been weakened to a synonym for *imprecation;* as, "As he walks through the streets, his very face denotes his horror of the world's wickedness; and there is always an *anathema* lurking in the corner of his eye" (*Trollope*). BAN implies a formal proclamation of outlawry or excommunication; as, "For centuries the languages which served men for all the occasions of private life were put under a *ban*, and the revival of learning extended this outlawry to the literature" (*Lowell*). *Curse*, *imprecation*, *execration*, and *oath* are frequently used to describe profane swearing. Cyb/e-le (sĭb′ē-lē), *n.* [L., fr. Gr. Κυβέλη.] The great nature goddess of the ancient peoples of Anatolia. Primarily she was a deification of the earth as sustaining and reproducing the wild life of nature; secondarily she was the nourishing mother of man, giver of the arts of life, and founder and upholder of cities and nations. She was thought to haunt mountain and forest fastnesses, accompanied by trains of wild attendants (Corybantes, Dactyli) bearing torches and dancing to music. Features of her service were, in early days, armed female temple attendants (prob. the Amazons of Greek legend); later, hierodules and emasculated priests, or Galli. Orgiastic rites and revelries were celebrated in honor of her and of her god lover, Attis, who typified the annually dying and rejuvenated vegetation. Phrygia, Lydia, and Mysia were the chief early centers of her cult, but it was widely adopted by the Greeks, who identified the goddess with the Cretan Rhea as **Rhea Cybele**, the Great Mother of the Gods. The Romans imported her cult direct from Asia Minor in 204 B. C. The goddess was represented as riding in a lion-drawn chariot or as enthroned between lions, wearing the mural crown, and holding the patera and tympanon. In mythology she was regarded as mother of Zeus and foster mother of Dionysus, and she was sometimes regarded by the Greeks as a form of Demeter, Artemis, or Aphrodite. dance, *n.* [ME. *daunce*, OF. *dance*, F. *danse*. See DANCE, *v. i.*] **1.** A measured leaping, tripping, or stepping, accompanied by turnings and movements of the body and limbs and in unison with music or rhythmic beats, performed as a manifestation of emotion, as a religious exercise, or as an amusement; act of dancing; esp., the amusement, in which the movements of the persons are regulated by art, in figures and in harmony with music. The dance in its most primitive form consists of a common movement, such as swaying or stamping, done by a group of performers to the accompaniment of rhythmic cries and hand clappings. In this and in developments characterized by the comparatively simple rhythmical movements of a group, the dance is a play or game (cf. WALTZ, POLKA, REEL, SQUARE DANCE, MINUET, etc.). But many primitive dances are performances in imitation of some action, story, or myth, done with magical or religious intent. The war, scalp, buffalo, snake, and sun dances of the American Indians belong to this class, as do also many forms of classic dance, as the dithyramb in honor of Dionysus, the dance of the Curetes, the dances of the Luperci and Salii in Rome. From these mimetic dances developed dramatic performances (cf. CHORUS, TRAGEDY, BALLET), and many forms of Oriental dancing to-day are practically dumb-show acting or posturing (cf. NAUTCH, HULA). Individual performances are a later development from all these forms of dance, and, as applied to European usage, *dance* commonly denotes a display of skill in rhythmic motion, sometimes with scenic or mimetic elements, as in the clog, the skirt, or the butterfly dance.
2. A round or turn of dancing; also, a social assembly for the purpose of dancing; a ball.

HAZARD implies danger from something fortuitous or beyond one's control; it is not so strong a term as *jeopardy*; as, "The amusements, even the active pursuits, of most of us remain wholly within the range of uncertainty, and, therefore, are full of *hazard* and precariousness" *(Froude)*; "There would have been no triumph in success, had there been no *hazard* of failure" *(J. Whitman)*. VENTURE, as compared with *hazard* and *risk*, implies a more voluntary assumption of (commonly) less imminent chances; as, "This was a *venture*, sir, that Jacob served for, a thing not in his power to bring to pass" *(Shak.)*. The theory maintains that organisms tend to produce offspring varying slightly from their parents, and that the process of *natural selection* (which see) tends to favor the survival of individuals whose peculiarities render them best adapted to their environment; also, that, chiefly by the continued operation of these factors, new species not only have been and may still be produced, but organisms of widely differing groups may have arisen from common ancestors. This view involved the substitution of a theory of *evolution* (which see) for the then generally accepted belief in the immutability and separate creation of species, though Darwin was by no means the first to suggest such a theory. Though natural selection is still universally recognized as an important factor, the most recent authorities attribute more weight than did Darwin to other influences as modifying the process of evolution. (Cf. LAMARCKISM, MUTATION.) A similar theory was arrived at independently by A. R. Wallace and announced at the same time as that of Darwin.

date line. 1. A line relating to a date or dates, as, in a newspaper, a line at the head of a letter, special article, or the like, giving its date (and usually place of origin).

2. Specif.: An hypothetical line, coinciding approximately with the meridian 180° from Greenwich, fixed by international or general agreement as the place where each calendar day *first* begins. The day for any given locality commences when it is midnight at that place; hence, any given day, say Monday, *first* begins at midnight on the date line, and following the midnight line begins continuously farther westward, in New Zealand, Australia, etc. It is thus Monday from the date line *westward* to the midnight line and Sunday from the date line *eastward* to the midnight line. Finally, as the midnight line reaches the date line again, it is for the instant Monday over practically the whole world; then Tuesday begins, and so on. Thus for the greater part of the twenty-four hours Hawaii has the same day name as San Francisco, and Manila the same day name (one day later than the day of Hawaii) as Australia. Thus, when it is Monday noon, May 1st, at San Francisco, it is 4 o'clock (standard time) or 14 minutes past 4 (local mean time) Tuesday morning, May 2d, at Manila. A vessel crossing the date line to the westward sets the date forward by one day, as from Sunday to Monday; if the line is crossed in going eastward, the date is set back. To avoid dividing places in close intercourse, the line is deflected between north latitudes 45° and 80°, so that all Asia lies to the west of it, all North America, including the Aleutian Islands, to the east; and between south latitudes 12° and 36° the line is deflected so that Chatham Island and the Tonga group lie to the west.

Syn. — DEADLY, MORTAL, FATAL. DEADLY applies to that which causes, or is capable of causing, death, or which is relentless or to the death; as, "his *deadly* wound" (*Rev.* xiii. 3); "his *deadly* arrow" (*Milton*); "Two brave vessels matched in *deadly* fight, and fighting to the death" (*Wordsworth*); *deadly* hate. *Deadly* has frequently the special implication of venomousness or virulence; as, "Poisons more *deadly* than a mad dog's tooth" (*Shak.*); "Two ringlets hanging heavy and *deadly* as small tired snakes" (*Swinburne*), *deadly* nightshade. MORTAL, as here compared, applies to the immediate cause of death, but not to a death-dealing instrument or agency; as, a *mortal* wound, a *mortal* disease (but not, a *mortal* arrow, poison, serpent). Like *deadly*, it may refer to that which is implacable or to the death; as, *mortal* hatred, a *mortal* enmity, *mortal* combat. FATAL (see *fate*, under DESTINY) applies to that which inevitably results in, or has already actually resulted in, death, as, a *fatal* illness, a *fatal* accident, a reply *fatal* to his hopes. See DEATHLY, DEATH, LIFELESS.

Theol.*, willful and deliberate transgressions, that take away divine grace and involve the death of the soul; — in distinction from *venial sins*. In the modern view, the distinction is one of degree instead of kind, some sins, as blasphemy, perjury, impurity, being, if deliberate, always mortal, while others, as theft, though mortal in their own nature, are venial if the amount of the wrong done is very small. Others again are venial in their own nature, and only become mortal under superadded circumstances. In the Fathers, mortal sins were sins of an aggravated character, which were specially named in the canons and synodal decrees, and which subjected a guilty person to canonical penalties. Sometimes mortal sins were simply those for which public penance was due (*Cath. Dict.*). The **seven deadly sins** of the old theologians are pride, covetousness, lust, wrath, gluttony, envy, and sloth.

Syn. — Deteriorate, decline, wither, waste, spoil. — DECAY, DECOMPOSE, PUTREFY, ROT, in common usage (for technical distinctions see defs.), agree in the idea of dissolution or disintegration. *Decay* and *decompose* do not necessarily convey repulsive implications; *putrefy* always, *rot* frequently, implies offensive odor. DECAY, the general term, suggests such deterioration or decline as is incident to the nature of things; as, "A mind that doth renew swifter than blood *decays*" (*Shak.*); "Love raised on beauty will like that *decay*" (*Pope*); "Lowness and *decayedness* of . . . fortunes" (*Clarendon*); "As winter fruits grow mild ere they *decay*" (*Pope*). ROT, the most vigorous term, may or may not imply offensiveness or foulness; fig., it differs from *decay* in suggesting stagnation or corruption rather than decline; as, "The . . . little pitted speck in garnered fruit, that *rotting* inward slowly molders all" (*Tennyson*); "*Rot*, poor bachelor, in your club" (*Thackeray*).

DECEIT commonly emphasizes the habit or practice, DECEPTION, the act, of deceiving; *deceit* always implies design, *deception* may be unintentional; as, addicted to *deceit*, skilled in *deception*; "In his simple show he harbors treason . . . a man unsounded yet and full of deep *deceit*" (*Shak.*); self-*deception* due to hasty observation. *Deception*, not *deceit*, applies to the state of being deceived; as, "Reason not impossibly may . . . fall into *deception* unaware" (*Milton*). DECEITFULNESS implies a disposition or tendency to deceive; as, "Sin, by that *deceitfulness* which the Apostle speaks of, . . . hides its deformed appearances from the eyes of foolish men" (*South*); "the *deceitfulness* of riches" (*Matt.* xiii. 22).
